My Contrubition

Problem Framing: Defined "usable access" as the core design challenge, grounding product decisions in dignity and reliability.

Product Design: Designed the MVP experience and interaction flows for a Mapbox-based web app demo.

System Design: Built a full brand and reusable UI components to support clarity, accessibility, and scale.

What is Toilet Delivery?

Toilet Delivery helps NYC delivery workers find the nearest usable restroom—fast.

Instead of showing every restroom pin, the experience highlights options that are open, realistically accessible, and worth the detour, so workers can take a respectful break without disrupting their route.

A bathroom break shouldn't be a negotiation.

The Problem

Delivery workers move on tight schedules, often without reliable access to restrooms.

When the nearest option is locked, “customers-only,” or hard to enter quickly, a basic need turns into lost time, stress, and unsafe workarounds. Existing restroom-finding tools rarely reflect what delivery workers actually need at street speed: certainty, fast entry, and confidence that the option is usable right now.

Anonymous Interviewee

“Many pees in bottles my husband used to do. People just would say no and you are delivering in residential estate in teh middle of nowhere.”

How is the problem currently being addressed?

Before designing TD, we looked at how people solve this today and where the gaps are.

1) Existing tools only support finding the restroom

Most restroom maps focus on existence, not access. They may list locations, but often miss the details that decide whether a restroom works in a delivery context: entry rules, hours, reliability, and what happens when a location fails.

2) Current solutions for delivery workers

Without a dependable source, workers rely on memory, luck, or negotiation: returning to “safe” spots, buying something just to enter, asking staff, or holding it until the route ends. These workarounds are inconsistent and expensive — especially when every minute affects income and ratings.

The screenshot displays a research dashboard with several sections:

- User Research - Where does Drivers go to the Bathroom when delivering?**
 - Links to Reddit comments and a survey.
 - List of items found in bottles: A bottle, A bush, The woods, A cup in the back of a van, Pops bottles, Car interiors - like, Car doors - like, Water bottles, Coffee cups, Delivery bottles, Coffee cups, A grocery store that offers restrooms.
 - Notes: "the restaurants I visit before picking up the order" since Covid-19 restrictions, a lot of restaurants don't even let you use their bathroom.
 - Hashtags: #Hill R.
 - Quote: "I'd get in trouble if you hop off route for 10mins an go take a piss at a gas station? My GPS tells us not to use our breaks and find a bathroom if we need. I just have getting off route."
 - Quote: "I didn't know robots piss."
- YouTube - about public needs**
 - Link to a video: <https://www.youtube.com/watch?v=b-8a2m9g>
 - Summary:
 - 1. Main Point: Drivers should never pee in the van or outside randomly. Always stop at a gas station, Walmart, or other public restroom.
 - 2. What Not to Do:
 - Don't pee in the back of the van, on bushes, in trees, or in bottles.
 - Don't pee in people's yards, grass, or behind dumpsters.
 - Don't leave pee bottles lying around.
 - 3. Why:
 - It's unhygienic and disrespectful to others who share the space.
 - It can cost you your job - some drivers have been fired for this.
 - It's hurting your health and professional reputation.
 - 4. Action:
 - Plan ahead and schedule bathroom stops.
 - Stay hydrated but manage your water intake wisely.
 - Take care of yourself - holding it or running through deliveries isn't worth the risk.
 - 5. Closing Message:
 - Remember like a respectful, responsible human being. Use proper restrooms, stay clean, and keep the job professional.

Desk Research on current solutions and pain points

What does “usable” really mean on a delivery route?

For delivery workers, a restroom's usability is shaped less by distance and more by risk and uncertainty. In practice, restrooms fail not because they're far away, but because access is denied, parking is risky, or availability disappears at the moment of need.

Top factors that make a restroom **unusable** during a delivery shift

*Parking / ticket risk
and Detour*

*Denied access (staff
says no)*

*No useable restroom
when needed*

Limited restroom access during
delivery shifts

Unpredictable entry & conflicting
access rules

**Lack of confidence at the moment
of need**

Confidence reduces wasted time and risk.

Although delivery workers initially describe their problem as “not enough restrooms,” deeper research revealed a different issue. Restrooms often exist, but access is unpredictable—denied by staff, unavailable at critical moments, or risky to reach during an active route.

What delivery workers lack isn't location information, but confidence that a restroom will be usable when they arrive.

“Usable” = fast, reliable, and low-friction.”

01 Predictability > proximity

Show options that are reliable, not just nearby.

02 Street-speed clarity

Design for one-handed use, quick scanning, and minimal reading.

03 Low-friction access

Reduce steps, avoid negotiation, and surface entry details before arrival.

Based on these principles, we designed TD to help delivery workers quickly identify the nearest usable restroom with confidence.

What are the Wellcome Collection app's key features?

Responsive Location, Map, and Toilet fetching

Fetching user's current location, displaying all available the toilet options around them. Identify different types of toilet place with icons shown coming with responsive map for user to adjust.

Supporting fast, street-speed navigation.

Using the 'Find nearest' button or select a restroom, TD integrates navigation to guide users there with minimal friction.

"Usable" = fast, reliable, and low-friction."

Restrooms are ranked by real-world usability rather than distance alone. Showing the type of the toilet and rating the quality of the restroom.

Adapting to different ways of moving through the city.

TD supports driving, walking, and cycling, updating routes and guidance accordingly. For each option, the app provides estimated travel time and distance, helping users quickly judge whether a restroom fits their current delivery window.

These features rely on quick recognition and predictable behaviour. To make that possible across the product, I created a unified visual system focused on clarity, accessibility, and consistency.

Design system & Brand

01. Introduction

We exist to give delivery workers predictable, dignified access to clean restrooms—fast. Our product makes the nearest usable option easy to find and easy to enter, aligning venues, platforms, and city partners so drivers don't have to negotiate or guess. The promise is simple: confidence in a quick, respectful bio break without disrupting the route.

Calm, clear, and human. We value dignity, predictability, and safety, we design for neutrality and low-friction use at street speed. Every touchpoint favors legibility over decoration, uses plain language, and defaults to accessibility (large tap targets, high contrast, inclusive icons). We're a good citizen in the city: respectful of venues, mindful of neighbors, and focused on solutions that work in the real world—today and at scale.

02. Logo

The Toilet Delivery logo is a clean monogram that fuses the initials T and D into a single, continuous shape. The horizontal top bar suggests a toilet lid, while the rounded "D" forms the bowl, turning the first letter of the app's name into a simple, iconic toilet silhouette. The dark blue line gives it a calm, reliable feel, helping users associate the service with safety, trust, and professionalism.

What was our impact?

Validation through real-world conversation

TD was presented and tested during Studio Open Day through a live prototype. Across conversations with delivery workers, students, and visitors, the problem resonated immediately. Rather than questioning the need for the product, most feedback focused on how the experience could better support fast, low-stress decisions during active routes.

This response validated our core insight: the challenge isn't finding restrooms, but **trusting that access will work when it matters.**

"This is actually something I need. I usually just guess and hope it works."
— Delivery worker, Open Day

"I like that it doesn't show everything, just the ones that actually work."
— Visitor feedback

How do we go from here?

Next step for TD

Commute Options & Toilet Option Chnage

Walking/ Bike/ PublicTransportation and More options for people to choose

Time of the day

Since some toilet spots are in the restaurant, it is better to

Locating Parking

Adding parking places' options that goes with the toilet around

Rating System

Would be better if the user are able to doo rating too as well

Since some toilet spots are in the restaurant, it is better to include the opening time of those places

Would be better if the user are able to add rating too as well, so it is not a one side information provide

My Takeaways

Progress comes from identifying clear insight and designing decisively around it. Move forward with informed assumptions, validate quickly, and refine through iteration.

Distinguish between what could be built and what should be built. Clarify the core value of the product. I learned to treat scope as a design decision, not a constraint.

Usability comes from subtraction. Prioritise the top options had a bigger impact than adding more features. Information hierarchy matters more than feature count.
